

PC1 COMPACT JOGGER

The PC1 "Compact" jogger is a fully automatic machine which, after selecting the strapping program (0, 1 or 2), is activated and does not require the intervention of any operator. It was manufactured to square and strap transversally packages of corrugated cardboard boxes. It combines the most up-to-date control and safety technologies in its sector with a robust, solid and long-lasting mechanical structure. It is reliable over time and integrates the simplicity of its use with limited maintenance, which are highlights of the industrial machines we manufacture. The machine is composed of an in-feed motorized roller conveyor that transports the package into the machine, where it is pressed by the upper top guide (if this option is present) and squared by two side stops of the lateral jogger and a frontal jogger group. The free roller conveyor in exit has the possibility to be opened to inspect the strapping group, while the wheels on the rails allow the manual (transverse) movement of the whole machine. The strapping machine with frame is integrated into the machine with a reliable TA-05 strapping group and frames with nylon guides and pneumatically controlled opening. The electric and the pneumatic panel on the machine, the controls on the 7" colour touch screen, the programmable PLC, complete the machine management and the indication of any anomalies. The lateral guarding outside the frame delimit the danger zone. Optionally the machine is manufactured to perform a double lateral squaring. A complete Periodic Maintenance Program and Tele-assistance (optional) guarantee the continuous functioning of the strapping machine over time, minimizing any anomalies and providing ready resolutions in addition to the traditional operation of the Emmepi Technical Service. The machine is manufactured in five widths, to be better adapted to the specifications requested by the customer.
